RESISTANCE WELDING PRODUCTS

The little “**TUFFALOY man**” is now over eighty years old. It was in 1937 that Welding Sales & Engineering Company of Detroit introduced a new line of resistance welding alloys tradenamed TUFFALOY. What began as just a part of a general line of welding equipment soon became their main business, as electrode holders and other resistance welding accessories were added to the TUFFALOY product line. Today this now-familiar name represents the most innovative and respected resistance welding alloy and accessory company in the field.

Even a catalog as comprehensive as this one does not fully show everything TUFFALOY is capable of supplying. In addition to the standard products in this catalog, TUFFALOY manufactures thousands of SKUs annually that are specially designed for unique customer applications. So, if you don't find the exact parts in these pages, tell us what you're looking for and let us work with you in designing the part to solve your resistance welding needs.

STANDARD ELECTRODES

	Straight Tips	4
	TUFFCAP Caps and Shanks	7
	Standard Bent Electrodes	12
	Miscellaneous Electrodes	14
	Back Up Electrodes	16
	Swivel Tips	17
	Refractory Metal-Faced Tips	17
	Threaded Electrodes	18

WELDING ELECTRODE HOLDERS

	Electrode Adapters	19
	Threaded Angle Adapters	26
	Cylinder-Mounted Holders	20
	Multi-Spot Barrel and Clamp	21
	Straight Holders	22
	Offset Holders	27
	Variable Offset Holders	28

WELDING ELECTRODE HOLDERS (continued)

	Paddle-Type Holders	29
	Platen-Mounted Holders	32
	Fast Follow-Up Holders	45

ULTRAPRESSURE HOLDER

	Ultrapressure Holders	46
---	---------------------------------------	----

HIGH PRESSURE WELDING

	Electrodes and Holders	30
---	--	----

NUT AND STUD WELDING

	Platen Mount Electrode Holders	32
	Nut and Stud Welding Electrodes	33
	Nut and Stud Welding Electrode Holders	34
	Metric Nut Electrode Systems	35
	GH Series Nut Welding Head	36
	Stainless Steel Pins for GH Head Style Welding	37
	TUFF BASE GH Holders	37
	Stud and Backup Welding Electrodes	39

MULTIPLE WELDING

	Teeter Tip Adapters	40
	Equatip Dual Tip Holders	41
	Equa-Press Dual Tip Holders	42
	Trispacer Triple Tip Holder	44

RESISTANCE WELDING ALLOYS

	Bar Stock	47
	Refractory Metals and Forgings	48

ACCESSORIES

	Shunts and Cables	49
	Stationary Water Tubes	20
	Electrode Taper Reamers	55
	Tap and TUFFCAP Taper Reamers	55
	Tip Dressing Tool	55
	Radius File	55
	Welding Tip Extractors	55
	TUFFCAP Extractors	55
	Quick Connect Couplings	55

ACCESSORIES (continued)

	Conductive Lube	55
	Water Hose Connectors and Clamps	55
	Weld Analyzer	50
	Weld Force Gauges	52
	Pneumatic Electrode Dresser	54

TUFFALOY STANDARD STRAIGHT TIPS

Straight tips from TUFFALOY are distinguished by their high conductivity and resistance to deformation, which are the two critical requirements of resistance welding tips. We ensure conformity to all RWMA standard dimensions and before shipment, all tips must pass rigorous quality control inspections.

The bright shiny look of TUFFALOY tips is the result of a passivation process that eliminates excessive oxidation. It reflects the deep-down quality built into these tips and into all TUFFALOY products.

Only RWMA Class 1 (C15000) and Class 2 (C18200) alloy tips are listed here. Class 3 (C18000) alloy tips are also available. For recommended uses of these alloys, see [page 56](#).

To order Class 3 (C18000) alloy tips, change description code to indicate it: see “Key to Description”, [page 6](#).

TUFFCAP™ electrodes consist of two pieces: a shank and a replaceable cap. These two-part electrodes can offer major economies, because when the nose geometry is worn out, only the cap needs to be replaced. And it costs far less than a standard one-piece electrode. (A TUFFCAP shank will normally outlast twenty caps.) Also, electrode inventory can be kept small because all nose designs will fit the same size shank.

TWO TYPES: TUFFALOY offers two kinds of TUFFCAP electrodes. One uses a male cap that fits into the shank. The other has a female cap that fits over the shank.

FEMALE AND MALE CAPS are available in the widest range of sizes, alloys, and styles. They are made in both Class 1 (C15000) and Class 2 (C18200) alloys, and in sizes to fit shanks sized 4 through 7 RW. Male caps are more effectively cooled than female caps.

TUFFCAP electrodes are offered with weld faces in conformance with RWMA standards.

SHANKS are made of Class 2 (C18200) alloy, either straight, or bent to provide an offset. Shanks other than those cataloged can be special ordered.

TUFFCAP caps and shanks should be used only in a directly opposed, straight-line manner.

TUFFTRODE-Z™ CAPS FOR COATED STEELS

To avoid electrode sticking problems common when welding galvanized and aluminized materials, these Class 2 (C18150) copper chrome zirconium alloy caps are offered. They give the same performance as dispersion-strengthened caps but cost far less.

TUFFCAP electrodes are offered with weld faces in conformance with RWMA standards.

Female Cap Type Electrode Assembly

Male Cap Type Electrode Assembly

Size 5 RW straight and offset style shanks holding male type caps with swivel heads. These caps are cataloged on [page 10](#) and [page 17](#).

NOSE TIP DESIGNS

A NOSE
POINTED FACE TIP

A general purpose weld face suitable for most spot welding applications

B NOSE
DOME FACE TIP

The most commonly used weld face because the design accommodates modest misalignment problems as contact can still be made on the radius during welding.

C NOSE
FLAT FACE TIP

Frequently used as a backup electrode for projection welding, cosmetic welds, or to control heat balancing of the weld by controlling the current density.

D NOSE
OFFSET FACE TIP

Used for welds in tight spaces typically on a flange or tight corner. It requires manual orientation during setup.

E NOSE
TRUNCATED FACE TIP

Efficient design that does not trap weld flash on the face and may reduce mushrooming.

F NOSE
RADIUS FACE TIP

Typically used for aluminum welding because it provides point contact to break through the aluminum oxide layer on the surface while still providing an adequate weldface to manage the current density during welding.

For improved cooling, standard female shanks are drilled through (to put water in contact with cap). Shanks may be ordered with a blind water hole. To order a blind water hole version of any female shank (straight or bent), add -BH suffix to the part number.

KNOW YOUR TAPERS

RWMA Cap Tapers are not compatible with the RWMA Standard Electrode tapers. The female and male cap tapers are designed with smaller engagement diameters as shown in the chart below. When using male and female caps make sure the mounting shank engagement diameter is correct.

STANDARD ELECTRODE TAPER

MALE CAP TAPER

FEMALE CAP TAPER

Female shanks (both straight and bent) can be ordered with special lengths, offsets, tapers, or materials as required.

PROPER WATER COOLING IS THE BEST WAY TO MAXIMIZE ELECTRODE LIFE

Water should be flowing at a rate of 0.5 to 1.5 gallons per minute. The gap between the bottom of the water hole and the end of the water tube should be 0.125 inches.

Male shanks (both straight and bent) can be ordered with special lengths, offsets, tapers, or materials as required.

DOUBLE BEND ELECTRODE, WITH STANDARD NOSE DESIGNS

These standard cold-formed tips are bent from straight tips (some after added machining) and have the same hardness and conductivity. They outlast, many times over, the old cast and forged tips of similar geometry, which are impossible to cool adequately.

The table shows a wide range of tips generally available from stock. For sizes not shown, refer to the diagrams and description key at the bottom of the page, and order what you need. All measurements will be accurate. However, overall length, in 1/8-in. multiples, will be held to within 1/16-in.

Tapers, water holes, and nose designs are the same as the standard straight tips in this catalog.

Water tubes can be furnished, add a -T suffix.

Standard nose designs other than those shown here may be furnished on short order. Follow the "Key to Description", using a 'B' for Dome nose, 'C' for flat nose, 'E' for truncated cone, and 'F' for radius nose.

MISCELLANEOUS TIPS

Double bend and flattened tips are made from bar stock. These are some of the standard designs available, but special designs can also be made. These are of Class 2 (C18200) alloy. Other alloys can also be ordered.

Additional Back Up Electrodes with Copper Tungsten Facings – See [page 39](#).

Swivel tips have ball-jointed swivel heads to compensate for minor misalignment, and to eliminate marking of the work surface. They are all machined from Class 2 (C18200) bar stock. The S- and SS-Series tip water hole does not reach the head. In the OS and OSH models, the water does contact the head, and O-rings are used to seal it. In the SS Series a spring is used to keep pressure on head for better positioning. **Class 1 (C15000) and Class 3 (C18000) heads are also available.**

Note: Standard swivel tilt is approximately 18°, a 25° swivel is available on request. Add suffix “-HS” to above part number.

The TUFFALOY copper-tungsten, tungsten and molybdenum-faced tips listed here withstand greater heat and pressure, at the expense of some conductivity. Besides being used for spot welding high resistance base metals, they are useful in achieving “heat balance” when welding dissimilar metals. (The higher resistance electrode is used against the lower resistance, or thinner, member, to help contain the heat generated.) They have the same diameters and tapers as the standard straight tips in this catalog. Bodies are of Class 2 (C18200) alloy. Lengths other than those shown can be ordered.

TUFFALOY CYLINDER-MOUNTED HOLDERS

These standard-tip holders are mounted directly to air or hydraulic cylinder pistons. They are ideal for assembling special multi-head resistance welding equipment. Current and coolant water are brought to each of the holders separately.

Electrode adapters for the tip diameter being used and in lengths to suit your set-up are ordered separately: see [page 19](#). Water tubes, for carrying water into the tip, should also be ordered separately. Stationary water tubes are listed below on this page. Water nipples are required and can be found under accessories on [page 55](#).

TUFFALOY offers both straight and offset holders for cylinder mounting. Clamps, hose connections, water tubes and adapters are not included. Order separately.

OFFSET HOLDERS

Offset holders are offered in eight offset sizes, from 1/8 to 1 inch. The standard models have a 1/2-NPT adapter socket, to hold adapters for 4 & 5RW tips. Ordering a 3/4-NPT socket will permit adapters for 6 & 7RW tips to be used. There is also a 7/8-14 threaded adapter socket available. All alloy is Class 2 (C18200).

OFFSET HOLDERS

Offset (inches)	Width (inches)	4 & 5 RW Part No. 7/8-14 Threads	4 & 5 RW Part No. 1/2" Pipe	6 & 7 RW Part No. 3/4" Pipe
1.0	2.5	194-1578	194-1588	194-1598
0.88	2.5	194-1577	194-1587	
0.75	2.31	194-1576	194-1586	194-1596
0.62	2.18	194-1575	194-1585	
0.50	2.06	194-1574	194-1584	194-1594
0.38	1.94	194-1573	194-1583	
0.25	1.81	194-1572	194-1582	
0.12	1.68	194-1571	194-1581	

ORDER CLAMP SEPARATELY

To determine distance adapter sticks out from holder, deduct 1/2-in. from length of adapter selected. Water tubes 1/2-in. longer than adapter will install approximately flush with adapter face.

STRAIGHT HOLDERS

Straight holders for multi-spot welding are available in two sizes, to carry tips having four different diameters. Series 101 holders are for 4 & 5RW tips, and Series 102 holders are for 6 & 7RW tips. They may be ordered with one or two sets of coolant ports.

Mating electrical contact surfaces of both the barrels and the clamp are silver plated.

ADAPTERS FOR MULTI-SPOT BARREL AND CLAMP

TUFFALOY threaded electrode adapters are used to provide longer electrode holder life, by providing a changeable electrode socket in holders having threaded openings. Standard electrode adapters are made of Class 2 (C18200) alloy. Other alloys available.

GOLDCROWN® EJECTOR HOLDERS
with self-adjusting water tubes

TUFFALOY Goldcrown® premium ejector holders are made of Class 2 (C18200) alloy and are ground and polished to yield greatest conductivity. These straight tip-ejecting holders deliver dependable, first class performance and are designed with maximum simplicity to require minimum maintenance. All TUFFALOY straight holders feature exclusive spring-loaded self-adjusting water tubes to ensure the proper flow of coolant through resistance welding electrodes. The larger ejector holders incorporate bigger fittings for higher coolant flow rates.

These adapters are supplied with -A suffix holder

Cross-section view of holders with barrels 1 inch or more in diameter.

Suffix “-A” in holder description denotes a threaded tip adapter is supplied

Cross-section view of holders with barrels 7/8 inch or less diameter.

GOLDSPOT® NON-EJECTOR HOLDERS with self-adjusting water tubes

TUFFALOY Goldcrown® premium non-ejector holders are made of Class 2 (C18200) alloy and are ground and polished to yield greatest conductivity. These straight non-ejector holders are now equipped with the same spring-loaded self-adjusting water tubes as the Goldcrown ejector unit, so electrode cooling is facilitated and improved. They are low in initial cost and inexpensive to maintain. Simple design and few parts contribute to low maintenance cost and excellent performance. Holders are heavy-duty and built to withstand very high welding rates.

ADJUSTABLE WATER TUBE USE

It is very important that resistance welding electrodes be kept as cool as possible; excessive heat softens them, allowing the nose to mushroom and weld quality to drop.

Adjustable water tubes are used to deflect incoming coolant water to the full extent of the water hole in the electrode. Before installing a tip, check that there is an adjustable water tube in place and that it is pulled out far enough so that it will contact the end of the water hole in the tip.

The drawing shows a typical straight holder, but the principle is the same for all types of holders.

Adjustable water tube correctly positioned in tip. Cold water will strike the hottest part of the tip first.

THREADED ANGLE ADAPTERS

TUFFALOY Threaded Angle Adapters fit threaded versions of the Straight Holders. The Threaded Angle Adapters allow you to reach into tight spaces and around obstructions to perform spotwelds in otherwise inaccessible locations. Each adapter includes a water tube to keep the tip cool and extend electrode life. The Threaded Angle Adapters are available in different taper sizes, angles, and with or without ejector buttons.

WELDER ARMS TUFFALOY

Class 2 (C18200) spot welding machine arms made by Tuffaloy reduce set up time and give longer life.

Electrode holder shanks can be attached to these arms from the front, by bolting the cap over them. This means no extra clearance is required between the arms to allow running a shank up (or down) into a hole in the arm. It makes the insertion of Tuffaloy multiple-welding holders much easier.

One of the most common failures of welder arms is the destruction of the bolt hole threads, due to the relatively soft copper involved. Tuffaloy arms have a transverse steel bar insert in which the bolt hole threads are cut. This provides greatly increased thread life.

Standard arm configurations are shown in the table.

Special arm configurations can be ordered upon request.

STANDARD OFFSET HOLDERS

TUFFALOY Cast Class 2 (C18200) alloy offset holders combine long life with good conductivity. Threaded tip adapters are easily replaced when tip socket is worn beyond use, or when you wish to change to a different taper size.

TUFFALOY offset holders are made in 2- and 4-inch offsets, and in four shank sizes, with 90° and 30° heads. They are supplied with adapters for No. 4 or No. 5 RW taper tips.

Tip Ejector mechanisms are available on all 90° head holders and the 30° head 4-in. offset holders.

TUFFALOY VARIABLE OFFSET HOLDERS

VARIABLE OFFSET HOLDERS		
Shank Dia.	Description	Part No.
1	SH-7223	345-7223
1-1/4	SH-7224	345-7224
1-1/2	SH-7225	345-7225

VARIABLE OFFSET HOLDER AND STRAIGHT SHANK TIPS

These offset holders provide a range of offset dimensions rather than one fixed amount, as with other one-piece offset holders. The top has a long shank and can be moved in or out to vary the offset anywhere between four and five inches.

The holders, all of Class 3 (C18000) alloy, are made in three barrel diameters: 1, 1-1/4, and 1-1/2 inches.

The tips are positional because they have no taper: they have straight shanks, and are held in any selected position by a locking-wedge device in the holder.

Tips are made in one and two-piece designs. The one-piece tips are offered with the nose designs shown. The two-piece tips are made up by combining the shanks shown here with Tuffcap caps (normally used with No. 5 RW size Tuffcap shanks). Either male or female Tuffcaps can be used with any No. 5 RW cap taper design offered on [page 7](#). All integral tips and shanks shown here are of Class 2 (C18200) alloy.

TUFFALOY PADDLE-TYPE HOLDERS AND SOCKET-TYPE TIPS

This holder is for welding in very restricted areas. It provides a very low head height and a four-inch offset. It is made in shank diameters of 3/4, 7/8, 1, and 1-1/4 inches. An adapter bushing is used to add a 1-1/2-in. dia. model to the line. Each holder comes complete with a socket-type tip (SE-3101) and holding screw. The tip may be inserted in either side of the paddle. Holders are of Class 2 (C18200) alloy. Tips are also available in Class 1, Class 2 (18150) and Class 3 alloys.

The four socket-type tips shown here can be used in special welding fixtures and dies as well as in the paddle-type holders.

TUFFALOY HEAVY-DUTY PADDLE-TYPE HOLDERS AND TIPS

TUFFALOY heavy-duty paddle-type holders are made of the stronger Class 3 (C18000) alloy, for greater rigidity and minimum deflection, even under loads of 1000 pounds and more. Class 3 (C18000) alloy provides 154% more tensile strength than the Class 2 alloy. Head height is a low 3/4-in. and the shank length is a usable 4 inches.

Three low-profile electrodes of Class 2 (C18200) alloy are offered for use in this heavy-duty holder. If applications permit greater head height, any standard No. 4 RW tip may be used.

Part No. 170-3249

HIGH PRESSURE TIPS

Spot and projection welding operations may utilize pressures over 2000 lbs. TUFFALOY high-pressure tips have flat bottoms which eliminates tip jamming in tapered holders. Assembled tip and holder heights are always the same, as contrasted to tapered tips which can be forced into the sockets varying distances.

TUFFALOY high pressure tips can be used in the two holder styles shown: PM holders for mounting on the platens of press-type welders, and straight holders for spot welder arm mounting. The tips are held to the holders by a threaded coupling. Copper tungsten faced tips are available for high pressure wear and projection welding.

STRAIGHT HOLDERS CLASS 2 ALLOY

Straight holders are made for carrying TUFFALOY high pressure tips in rocker arm welders or press-type welder horn extensions. They are made in two basic sizes, to accommodate Size 1 and Size 2 High Pressure tips. They are of Class 2 (C18200) alloy and hold the tips in the same manner as do the PM holders.

Size	Barrel Dia.	Description	Part No.
1	1	4511	350-4511

Size 2 PM holder (3/4-in. mounting bolts)
4520 holder, Part No. 350-4520

HIGH PRESSURE PM HOLDERS

TUFFALOY PM holders may be mounted directly to press-type welder platens, or they can be used as components of special weld fixturing. They come in two sizes, which match standard T-slot spacings. The smaller holder is for use on RWMA Size 1 welders, which have the 3-1/2" spacing. The larger one is for the Size 2 and 3 welders, which have the 5- and 6-inch spacing.

Big, half-inch mounting bolts may be used to assure good conductivity. The holders may be used one-to-one or in multiples closely bunched. PM holders make special fixture building easy. They can be bolted to a fixture or back-up base as easily as to a platen. They are compact and have self-contained coolant systems. These PM holders are made of Class 2 (C18200) alloy.

Fixture Building: PM holders make special fixture building easy too. They can be bolted to a fixture or backup base as easily as to a platen. They are compact and have self-contained coolant systems that eliminate making a coolant manifold out of the fixture.

Hose Connections: You may specify where you want the hose connectors in the hexagonal base. Select any two of the six possible locations and specify by using the symbols shown on the diagram (connector locations: A-B, or A-D, etc.). Position A-C is standard. (A-F and C-D are not possible.)

Hose Connection Orientation Options

PM HOLDERS

TUFFALOY PM holders may be mounted directly to press-type welder platens, or they can be used as components of special weld fixturing. They come in two sizes, which match standard T-slot spacings (either of which can be furnished to hold any of the four standard tips: 4, 5, 6 or 7 RW). The smaller holder is for use on RWMA Size 1 welders, which have the 3-1/2" spacing. The larger one is for the Size 2 and 3 welders, which have the 5- and 6-inch spacing.

Big, half-inch mounting bolts may be used to assure good conductivity. The holders may be used one-to-one or in multiples closely bunched. PM holders make special fixture building easy. They can be bolted to a fixture or back-up base as easily as to a platen. They are compact and have self-contained coolant systems. These PM holders are made of Class 2 (C18200) alloy.

The orientation of the Hose Connections can be specified to fit your fixture layout. See [page 31](#) for orientation options.

ELECTRODES

Stud Electrodes

Tuffaloy stud electrode tips are for projection-welding screws, bolts or pins, whether they pass through the sheet or are to be attached directly to its face.

Nut Electrodes

Tuffaloy projection weld nut electrodes are designed for either self-piloted or non-piloted nuts. The pilots of the non-piloted-nut electrodes are spring-loaded so they can't interfere with the contacting of nut and sheet under welding pressure.

- A. Welding a stud through a hole in sheet metal.
- B. Welding a stud directly to face of sheet metal.
- C. Self-piloted nut aligns itself with the hole in sheet.
- D. Non-piloted-nut is guided by specially designed electrode.

The various types and sizes of TUFFALOY stud-and-nut welding electrodes and holders are described below. For excessive wear applications, any of these electrodes can be ordered with refractory alloy facings, such as TUFFALOY 10W.

METRIC NUT ELECTRODES

TUFFALOY now stocks the head/pin style welding system components that add to your selection for stud and nut welding needs. For a complete and updated listing of electrodes that will best meet your needs visit tuffaloy.com/products/nut-and-stud-welding.

Heads are made from RWMA Class 2 (C18200) alloy that are an optimal performance consumable. Class 2 (C18200) with 10W (copper tungsten) face are available for longer life. With a concave seat the pin locates in the center of an assembly when air is applied to the system. This gives you a repeatable location for automated nut feeders to introduce the nut to the environment.

Pins have a nonconductive surface on a steel matrix that gives longer life in a repetitive motion environment. With the threaded head securing the pin in place it makes it easy to replace the pin to meet your requirements. TUFFALOY can design pins for special applications.

WHEN SPECIFYING A PIN AND GH HEAD COMBO, ALLOW .005" TO .010" GAP PER SIDE BETWEEN THE PILOT DIAMETER AND THE GH HEAD HOLE DIAMETER

TUFFALOY TUFF BASE SERIES OF ELECTRODE HOLDERS

Tuffaloy's TUFF BASE series of electrode holders are designed for use with GH Head style weld heads. The TUFF BASE can be used in both Nut and Stud welding applications. All TUFF BASE units include a return spring and cup for holding weld pins. EVOLUTION™ GH Heads and SS Weld Pins are sold separately.

The benefits of the TUFF BASE series are:

- Water cooling channels to cool the weld head and extend electrode life
- Inlet airport for blowing air through the part to prevent slag buildup
- Low maintenance design

The TUFF BASE series are available in the following mounting base configurations:

PLATEN MOUNT BASE DESIGN

These series of Stud electrodes are made from RWMA Class 2 (C18200) alloy with 10W (copper tungsten) on the weld face and wrench flats for easy removal from holders. The Insulator is made to withstand the constant friction that is applied as the stud is inserted and removed.

QUICKEST WAY TO CUT WELDING COSTS

Increased productivity without capital investment or increased labor costs just has to spell PROFIT. Hundreds of resistance welding users are profiting from the TUFFALOY methods of multiple welding, to produce almost any assembly requiring closely spaced welds.

The key is to **“think multiple!”** Whenever the welding machine goes through a cycle, have it do more than one weld at a time. It’s easy and practical with one of the TUFFALOY multiple welding devices: The Teeter-Tip dual tip adapter, the Equatip dual tip holder, the Equa-Press dual tip holder, or the Tri-Spacer.

They’re ready to go to work, cutting costs and increasing production efficiency for you.

Study the multiple welding holders and adapters in this section. Learn their capabilities, **“think multiple,”** and you’ll probably see many ways in which TUFFALOY multiple welding solutions can improve your operation. Remember that TUFFALOY is prepared to provide any special fixturing you need. Show our engineers what you require, and they’ll design a set-up to do it.

TEETER-TIP DUAL TIP ADAPTERS

U.S. Pat. 3,356,821

You can spot or projection weld in half the time by doubling the number of welds per machine stroke. Use Teeter-Tip dual tip adapters, which come with water-coolant fittings to beat high heat build-up. These adapters transmit total pressures of 1000 lbs., and deliver equal current and pressure to each tip. They compensate for normal electrode wear, imperfect tip dressing, and work variations up to .060”.

LIGHT-DUTY adapters are available with No. 4 or 5 RW shanks to mount the holder to a barrel or other electrode holder. The Teeter-Tip holder is designed to hold male TUFFCAPS or 4 RW tips. The tips can be spaced up to 4 inches apart.

HEAVY-DUTY adapters are available with No. 5 to 7 RW shanks to mount the holder to a barrel or other electrode holder. The Teeter-Tip holder is designed to hold male TUFFCAPS or 4 RW tips. The tips can be spaced up to 6 inches apart.

Two low-height 5/8” dia. cap-type tips are shown below. They are recommended for use in these adapters. All the available socket taper options for the tips are shown in the table below. You must specify the size tip sockets you want, or the standard socket will be supplied.

*When ordering, also state exact tip spacing and tip socket size, Example: TT-1508-1.500-5CT. (5CT means 5/8” diameter cap, 4CT means 1/2” diameter cap.)

EQUATIP DUAL TIP HOLDERS

U.S. Pat. No. 3,558,847

The Equatip dual tip holder is a smaller version of the Equa-Press holder (on next page). It is more compact, and is more economical for those applications where it will work equally well. An even smaller device, the Equatip Adapter (not water-cooled) is shown in box below.

Using the Equatip holder, both tips contact the work squarely, because tip axes remain parallel to direction of force (unlike the Teeter-Tip adapters). An internal roller equalizes current and pressure between the two electrodes, and will compensate for work height variations up to 1/16".

The holders are ordered with either 1" or 1-1/2" spacing between barrels. Standard holders are available with either male Tuffcap caps (5/8" dia.) or straight No. 4 RW electrodes. (Bent tips are not recommended.) The distance between welds can be varied by rotating offset D-nose tips in the barrels.

Equatip holders can be supplied with straight shanks for arm mounting, a tapered adapter shank for holder mounting, or a cylinder adapter shank to be clamped to a cylinder rod. Special width spacing is available as a special item.

Equatip holders can be used with forces up to 1000 lbs. The minimum spacing width is 0.750" and maximum spacing width is 4.000".

EQUA-PRESS™ DUAL TIP HOLDERS

U.S. Pat. No. 2,979,599
Canada Pat. 637470

The Equa-Press Holder makes two identical welds at once. When it contacts the workpiece, the forging pressure is automatically equalized between the two electrodes, regardless of variations in work thickness, or electrode wear (up to 3/16"). The two tip-holding barrels are sliding pistons, whose movements are controlled by a mechanical equalizing slide in the housing (see cutaway drawings). The spring's only function is to return the barrels to a fully extended position when there is no work contact. Maximum conductivity is maintained through sturdy copper alloy working parts. Spacing can vary up to 4 inches, using TUFFALOY bent offset tips in Equa-Press holders having the standard barrel spacing of one and three quarters inches.

Barrel spacing from one and three quarter inches to six inches is available as semi-standard. These are drilled to order from stock components. To order you must give the barrel spacing desired, along with the Item number (from table).

Equa-Press Holders are made in two mounting styles: platen models to mount directly to the platen on press-type welding machines, and shank models for rocker arm machines. All are available in two designs: the standard and the short (close-coupled) type. The short design is internally flood-cooled and takes up less space in the welder.

Equa-Press holders can be used with forces up to 1500 lbs. The minimum spacing is 1.75 inches.

Mounting Style	Standard Design		Short Design	
	Descrip- tion	Part No.	Descrip- tion	Part No.
1-in. shank	4010	350-4010	4015	350-4015
1-1/4-in. shank	4011	350-4011	4016	350-4016
1-1/2-in. shank	4012	350-4012	4017	350-4017
Platen	4013	350-4013	4018	350-4018

Note: For best results, position the holder so that a line drawn through the electrode centers is at, or nearly at, right angles to the direction of the welder arms. Otherwise, the magnetic field between the arms can cause an excess of current to flow through the inboard electrode.

1-1/2	4022	350-4022

LOWER HOLDERS AND ELECTRODES FOR USE WITH EQUA-PRESS HOLDER

A lower, fixed, dual tip holder is offered for use with Equa-Press Holders. Like the Equa-Press, it has a standard two-inch tip spacing and helps make two welds at once, precisely alike. The standard transverse bar electrode shown is used when work geometry doesn't require tips on the lower side. They are both water-cooled.

A Case Study: Projection welding brackets to automotive frame assemblies is twice as fast with an Equa-Press dual tip holder. Lower welding fixture acts as an inspection device, so warped parts are discovered before welding. Inspection time and scrap loss are both reduced.

A Case Study: Joining a piece of metal to itself is always tough. This job was done with an Equa-Press holder - two at a time. Lower clamp faces, carrying current, contact parts near the weld areas to avoid current bypassing weld projections. Two standard swivel tips make four welds, two per part.

A Case Study: Dual spot welding of panelled wall sections reduced welding costs enough to justify buying welding machine to do the job in-plant. Equa-Press holder with 5-inch spacing, and special (but simple) tooling to provide two offset tip adapters and matching holders were used. Electrodes are standard TUFFCAP caps.

In this drawing, two studs are projection welded in each welder stroke, using an Equa-Press dual holder over a pair of studwelding electrodes held in PM-style holders.

Here, four spot welds are made simultaneously on a corrugated part. An Equa-Press dual holder is used to hold two Teeter-Tip dual tip adapters.

TRISPACER HOLDER

1-1/4-in. shank	4041	350-4041
1-1/2-in. shank	4042	350-4042
Platen	4043	350-4043

TRISPACER™ TRIPLE TIP HOLDER

U.S. Pat. No. 3,558,848

The Trispacer tip holder will make three spot welds at one time, automatically splitting the current and the pressure equally between the three tips. In doing so, it compensates for variations in work thicknesses and electrode wear-up to 3/16-in.

The three tip-holder barrels (#5 RW) are equidistant from one another, all falling on a 1-5/8 inch diameter circle (in the standard model shown). Using straight tips the weld pattern would form an equilateral triangle. However, the weld pattern can be widely varied by using standard or special bent tips. In fact, the three welds can be made in a straight line.

The Trispacer Holder works in the same simple, mechanical way as the Equa-Press Holder: The tip-holding barrels have a limited up-and-down movement, to accommodate work conditions, and are adjusted to deliver equal pressure by the cone-shaped equalizing device in the housing. All current-carrying parts are made of RWMA copper alloys. It is made in two styles: to mount directly to the platen of press-type welders, and with shanks to fit in welder arms.

Trispacer Holders can be used with forces up to 2000 lbs.

LOWER ELECTRODE

A simple, water-cooled lower electrode is made for use with the Trispacer holder. Its three-inch-diameter face makes it usable with any weld pattern that may be developed for the Trispacer. It comes in three shank diameter models.

LOWER ELECTRODE

Shank Dia.	Description	Part No.
1	4025	350-4025

1-1/2	4027	350-4027

U.S. Pat. No. 3,632,958 Canada Pat. No. 902,189

TUFFALOY fast follow-up (low inertia) holders solve the problem of maintaining adequate weld pressure on rapidly collapsing projection welds-with fewer set-up problems and reduced maintenance.

These holders can be set to deliver fast follow-up forces ranging from 140 to 1300 pounds, a range covering 90% of all projection welding operations. They are compact, water cooled, and easy to maintain.

Plus features of the TUFFALOY fast follow-up holder include: (1) wider range of pressures than any competitive make (2) no flexible shunt (a common cause of holder failure) (3) use of standard, unmodified die springs, so if you need a spring of different strength, it's easily available (4) spring forces available are clearly indicated, so it's easy to set up for a specific force (5) three shank sizes, or it can be platen-mounted-the only fast follow-up holder that can (6) extremely low height permits use where larger units can not be used.

TUFFALOY fast follow-up holders can be used to limit the weld pressure of any spot welding machine regardless of cylinder size or air pressure. This is better than reducing air pressure, which slows the return stroke and retards production.

Current flow follows dashed arrow through the outer body, two split contact rings, tapered tip socket, and to the electrode.

For every one-eighth of an inch that a fast follow-up is compressed when setting up, a known amount of force is provided, to quickly follow up any reduction in work thickness. Example: at position B, a type MH spring would deliver 310 lb, at C, 440 lb, etc.

FAST FOLLOW-UP FORCE CHART (LBS.)				
Spring Type	1/8-in. Compression	1/4-in. Compression	3/8-in. Compression	1/2-in. Compression
M (300 lbs. max.)	140	200	250	300
MH (680 lbs. max.)	310	440	560	680
H (1300 lbs. max.)	600	840	1070	1300

ULTRAPRESSURE™ FAST FOLLOW-UP HOLDER SYSTEM

U.S. Patent 12,186,824

TUFFALOY'S UltraPressure™ Fast Follow-Up Holder System is a low profile, spring loaded electrode holder designed specifically for new or existing resistance welding tooling that requires the additional follow-up force. Available in a range of forces from 750 to 10,000 lbs., utilizing easily replaceable die springs to configure the holder to the weld application. These holders are especially effective for projection welding on Advanced High Strength Steel (AHSS), and in conjunction with Fast Rise Time (FRT) Transformers. UltraPressure body weighs 8.8 lbs.

MOUNTING OPTIONS

TUFFALOY extruded bar stock is used for fabricating special electrodes, platens, adapters, and other conductive parts. Round bar is available in all three alloy classes (1, 2 & 3). The other shapes are made in Class 2 and 3 alloy. Physical properties are superior to those shown on [page 54](#).

Bar stock is priced per pound in random mill lengths, from 8 to 12 feet. Additional charges are made depending on specific weights and lengths ordered.

Stronger, generally harder, and having less conductivity, the refractory metal compositions include copper-tungsten (Classes 10-11), tungsten (Class 13) and molybdenum (Class 14) alloys.

The bars and inserts listed below are made in the following RWMA group B alloys: Class 10 (Tuffaloy 1W), Class 11 (Tuffaloy 10W), and Class 12 (Tuffaloy 20W).

Bars and inserts of Class 13 (Tuffaloy 100W) and Class 14 (Tuffaloy 100M), as well as special sizes and shapes, are priced on request.

COPPER TUNGSTEN ROUND BARS

Eight inches long, available in the following diameters:

From 1/8" to 2".

COPPER TUNGSTEN RECTANGULAR AND SQUARE BARS

Eight inches long, available in following dimensions:

Widths from 1/8" to 2" and Thicknesses from 1/8" to 1".

COPPER TUNGSTEN ROUND INSERTS

Available in following dimensions:

Diameters from 1/8" to 2" and Thicknesses from 1/4" to 1".

TUFFALOY forgings are used to make seam welder wheels and shafts, butt and flash welder dies, and welder arms and platens. Forgings are superior to castings in physical properties and in absence of porosity. They are available in TUFFALOY 88, 77 and 55 (Class 1, 2 and 3 alloy). All are readily machinable.

When ordering specify whether forging is to be as-forged or finish machined. Regardless of how it is wanted always order by giving finish dimensions.

SAFETY DATA SHEETS

www.tuffaloy.com/technical/sds

LAMINATED COPPER SHUNTS

Manufactured top-of-the-line shunts with short lead times, lower resistance, enhanced performance, durability, customization options, and unmatched customer support. Laminated copper shunts are made to your size and shape specifications. High conductivity electrolytic copper strip is used, and terminal clips are riveted in place. Loose ends or soldered dipped ends are also available.

AIR-COOLED JUMPER CABLES

Air-cooled jumper cables are flexible, high-conductivity copper conductors with insulative sleeves. They are made in lengths to suit your needs.

STANDARD

The standard weld cable is suitable for most applications and is commonly found on standard press type, rocker arm or custom Welding machines.

XTRA FLEX

The Xtra Flex Cable is less rigid and has higher a higher cooling rate Xtra Flex than standard cables due to extra spacing between the wire strands. The cable is recommended for robotic applications where the weld cable may be twisted or curled during operation.

**Water Cooled and Kickless Cables are available upon request.*

STANDARD DIMENSIONS (INCHES)

MCM Rating	O.D. (approx.)	Lug Width A	Lug Thickness B
600	1-5/8	1-3/8	.50
750	1-3/4	1-3/8	.60
1000	2	1-1/2	.70
1200	2-1/8	1-1/2	.82
1500	2-1/4	1-1/2	.99

Holes are 17/32 unless otherwise specified.

WA2 WELD ANALYZER

- Current meter
- Easy to use
- Easily legible in all lighting conditions
- Positive keypad action
- Suitable for various applications
- Reads wave forms from 50 Hz upwards
- Traceable accuracy
- Data archiving
- Small and lightweight allowing for easy portability
- Calibration services available
- One year warranty

FEATURES

- Intuitive, flexible interface
- LCD 128 x 64 pixels FSTN with yellow/green backlight
- Embossed disc tactile keypad with antiglare display window
- Auto power-off
- Large choice of coils
- AC or MFDC operation
- Calibration certification
- USB connection
- Includes 6 inch flexible coil, batteries and carrying case
- Integrator output for oscilloscope connection
- WA Terminal software

OPTIONS

- Flexible coil – 3 inch (Part No. 313027) or 12 inch (Part No. 313021) diameter with 6.5 feet lead
- Attenuator – range multiplier for up to 300kA (Part No. 316009)
- Extension cable – 10 meters (Part No. 316010)

WA2 WELD ANALYZER VIDEO

WA2 WELD ANALYZER SPECIFICATIONS

The Weld Analyzer offers the engineering professional the facilities to analyze, fault-find and improve process quality on today's sophisticated welding control systems. Full traceability gives you the confidence in your processes that your customers demand.

- POWER SOURCE:** Rechargeable NiMH
- DISPLAY:** 128 x 64 pixels FSTN transfective with yellow/green backlight
- CURRENT RANGE:** 2.00 to 60.00 kA
- CURRENT DURATION:** 9999 cycles (AC), 199.9 seconds (DC)

MONITORED PARAMETERS:

Current	Time	Conduction Angle	Position
Peak RMS	Total weld time	Average conduction angle	Position of monitored parameter in weld pulse train
Average RMS	Any pulse time	Conduction angle of every sample	
Lowest RMS	Number of pulses	Accuracy ± 4°	
Accuracy +/- 2% of full scale	Accuracy +/- 0		
Measures and displays values for each + and - 1/2 cycle			

PROGRAMMABLE PARAMETERS:

AC	DC
Frequency	Current threshold
Blanking	Blanking
Weld capture	Weld capture
USB DRIVERS:	www.ftdichip.com/Drivers/VCP.htm

HIGH-ACCURACY WELD FORCE GAUGES AVAILABLE FROM TUFFALOY

Digital-Electronic Weld Probe

DLC Digital-Electronic

Digital Hydraulic Gauge

Analog-Hydraulic

DLC Gauge Insulation Boot

Part No. 601-1006

Hydraulic Gauge Insulation Boot

Part No. 601-1104

Note: only compatible with swivel head style analog hydraulic and digital hydraulic gauges

THE BROADEST PRODUCT LINE OF FORCE GAUGES FOR RESISTANCE WELDING

Tuffaloy supplies a range of weld force gauges, available with accuracies from $\pm 0.5\%$ for Digital-Electronic gauges; to our Hydraulic models with 2%-3% accuracy. All are available in English and metric readouts.

Our **Digital-Electronic Weld Probe** weld through force gauge offers the highest accuracy of $\pm 0.5\%$ for 95% of the gauges range. The gauge has large LCD readouts with peak-hold capabilities. All functions are electronic which prevents variations caused by flexing.

The **DLC Digital-Electronic** force gauge delivers better accuracy than hydraulic gauges, over a broader range of forces, due to the advanced digital load cell. Users can easily select their preferred units of measure in pounds, kilograms, newtons and kilonewtons. The peak-hold feature allows for reading variable forces, which are common in resistance welding machinery. Gauges maintain an accuracy of $\pm 0.5\%$ for 30% to 90% of the gauge's range.

Tuffaloy's **Analog Hydraulic and Digital Hydraulic** force gauges are the low cost method for obtaining general force measurements. These gauges are available in a standard block style, with sizes ranging from 600 to 10,000 pound maximum load, with accuracy ranging from 2 to 3%. See chart on [page 53](#) for details.

CERTIFICATE OF CALIBRATION, RECERTIFICATION AND REPAIR SERVICES

All gauges are sold with an NIST traceable calibration, performed by Tuffaloy in house at time of sale. Units in the field may be sent in for recalibration and recertification. If the unit is not in good working order Tuffaloy can repair the unit prior to calibration and certification. If repaired by Tuffaloy there is no additional cost for calibration and certification.

The DLC, Digital-Hydraulic, and Analog-Digital Weld force Gauges are warranted to be free from defects in materials and workmanship for 12 months.

*Analog & Digital Hydraulic gauges should be selected to be used near mid-range.

PNEUMATIC POWER HANDLE ELECTRODE DRESSER PART NO. 18-1310

Light weight and rugged construction, this Pneumatic Power Handle requires a clearance of only 1-1/2" with a standard ring and 2" with an extended ring. In most situations this allows dressing of electrodes without removal from the welder. Operating at a cutting speed of 1200 rpm, it enables the operator to dress electrodes quickly and accurately. Cutters and guide rings are easily replaced. These must be matched to the electrode nose and are selected from the chart below.

Electrode Dresser 18-1310 is supplied without blade holder, ring, and cutter blade. When ordering, specify the "Kit" appropriate for your dressing needs as selected from the table below. "The stud" furnished with the kit is not required when using the Pneumatic Power Handle. It may optionally be used, but will increase the clearance required on the welder for dressing. Additional special cutters can be furnished upon special request.

These kits may also be used for cap electrode dressing.

** Note: This kit includes Stud for (for 3/8 Keyed Chuck), Chuck, 1 Guide Ring, 1 Appropriate blade, and Retaining Nut.

Note: Cutters are **NOT** designed to conform to "Electrode Cap" geometries. Caps are intended for value salvage when expended.

ELECTRODE TAPER REAMERS & TAP

Hole in reamer center permits water tube entry; no need to dismantle holder. 4 RW, Part No. 601-0004; 5 RW, Part No. 601-0005; 6 RW, Part No. 601-0006; 7 RW, Part No. 601-0007. 5/8-14 NPT Tap, Part No. 601-0025

TIP DRESSING TOOL

To remove mushroomed nose material on a pair of tips of 4 or 5 RW size, having pointed or dome noses. Other nose design dressers on special order. Dresser, Part No. 601-0102; Dresser cutter, Part No. 601-0103.

RADIUS TIP FILE

Tip File

To restore original contours of welding tips use this two-inch radius file. File, Part No. 601-0120; Handle, Part No. 601-0120-H; File & Handle, Part No. 601-0120-A.

WELDING TIP EXTRACTORS

No. 4 RW and 5 RW at opposite ends, EX-3, Part No. 601-0203

No. 4 RW, EX-1, Part No. 601-0201
No. 5 RW, EX-2, Part No. 601-0202

Standard Duty: EX-10-A, Part No. 601-0231
Heavy Duty: SW-250, Part No. 601-SW-250

TUFFCAP ELECTRODE REAMERS

To ream or dress tapers to hold male caps. 4 RW, Part No. 601-0014; 5 RW, Part No. 601-0015; 6 RW, Part No. 601-0016.

QUICK-CONNECT COUPLINGS with automatic shut-off

Use these couplings to make up efficient, trouble free coolant systems. Any plug shown will mate with any socket shown. Always put the socket on the upstream side of a connection. Its built-in valve will automatically close upon disconnection.

1/8" NPT female plug
Part No. 601-0300

1/8" NPT female socket
Part No. 601-0314

1/8" NPT male plug

TUFFCAP EXTRACTORS

Male Caps, 4 & 5 RW, EX-45, Part No. 601-0240
Male Caps, 5 & 6 RW, EX-56, Part No. 601-0242

Male cap extractor has long lever handles for easier cap removal. In two dual-size models: EX-45 and EX-56.

Female Caps, 4 RW, EX-4F, Part No. 601-0220 Male Cap 4 RW
Female Caps, 5 RW, EX-5F, Part No. 601-0221 Male Cap 5 & 6 RW
Female Caps, 6 RW, EX-6F, Part No. 601-0222 Male Cap 7 RW

Female cap extractors are made for three Tuffcap shank sizes: Models EX-4F, EX-5F, and EX-6F.

RECOMMENDED USES OF RESISTANCE WELDING MATERIALS

GROUP A COPPER-BASE ALLOYS

RWMA CLASS 1 ALLOY • TUFFALOY 88

ZIRCONIUM-COPPER (1.15000), is suited to welding aluminum and magnesium alloys, coated materials, brass and bronze.

Class 1 alloy is superior to pure copper as an electrode material and is recommended as a general purpose material for resistance welding use. It may be used for spot welding electrodes, seam welding wheels and welding fixture components. It is not heat treatable.

RWMA CLASS 2 ALLOY • TUFFALOY 77 AND Z

TUFFALOY 77 CHROMIUM-COPPER (2.18200), is suited to welding cold- and hot-rolled steels, stainless steel, and low-conductivity brasses and bronzes.

Class 2 alloy is a superior resistance welding electrode material, recommended for high-production operations. It is used for welding electrodes, projection welding electrodes, seam welding shafts and bearings, flash and butt welding electrodes, and current-carrying structural components. Available in forms for use as welding gun arms, welding platens and secondary-circuit structural members. It is heat treatable.

TUFFALOY Z ZIRCONIUM-CHROMIUM-COPPER (2.18150), is suited to welding galvanized steel and other metallic-coated steel.

This is a specially heat-treated alloy which meets the minimum electrical conductivity and hardness specifications of Class 2 alloy.

RWMA CLASS 3 ALLOY • TUFFALOY 55 AND 55A

TUFFALOY 55 BERYLLIUM-NICKEL-COPPER (3.17510), is suited to welding steels having high electrical resistance, such as stainless steel.

TUFFALOY 55A NICKEL-COPPER (3.18000), is a beryllium-free alloy with properties similar to TUFFALOY 55.

Class 3 alloy is recommended for projection welding electrodes, and flash and butt welding electrodes. With its higher strength it is also used on highly-stressed current-carrying parts such as electrode shanks and heavy-duty electrode holders. It is heat treatable.

RWMA CLASS 4 ALLOY • TUFFALOY 44

BERYLLIUM-COPPER (4.17200) has extremely high hardness, and is recommended for projection, flash and butt welding electrodes. It has lower conductivity than Class 3 alloy but it is harder and more wear resistant. It should be considered where there is concern with high pressure density and severe wear, but where heating, due to its low conductivity, is not excessive.

It is used frequently in the form of inserts, tooling facings, and seam welder bushings. It is available in the annealed condition which is more readily machined and then subsequently heat treated.

GROUP B REFRACTORY METAL COMPOSITIONS

RWMA CLASS 10 • TUFFALOY 1W

TUNGSTEN 55% – COPPER 45%, suited for facings and inserts for projection welding electrodes and flash and butt welding electrodes. It is recommended where (relatively) high electrical conductivity and some degree of malleability is desired.

RWMA CLASS 11 • TUFFALOY 10W

TUNGSTEN 75% – COPPER 25%, suited to similar applications as Class 10, and for facing on electrode forming electrodes. It is harder than Class 10, and is for general use in projection welding electrodes.

RWMA CLASS 12 • TUFFALOY 20W

TUNGSTEN 80% – COPPER 20%, suited for electro-forming and electro-forging facings, and for electrode facings used to upset studs and rivets. A material for heavy-duty projection welding electrodes.

RWMA CLASS 13 • TUFFALOY 100W (Pure Tungsten)

RWMA CLASS 14 • TUFFALOY 100M (Pure Molybdenum)

Class 13 & 14 materials are used primarily for welding or electro-brazing non-ferrous metals having relatively high electrical conductivity. They are suited to cross-wire welding of copper and brass, and for welding copper wire braid to brass or bronze terminals. Special set-ups and procedures are required.

 III - RWMA CLASS 3
 IV - RWMA CLASS 11 - 10W
 V - RWMA CLASS 14 - 100M*
 VI - RWMA CLASS 10 - 1W Δ
 *100W may be substituted.
 Δ = RWMA CLASS 11 may be interchanged.
 O = Electrode materials in circles are second choice.

WELDABILITY
 As a basis for comparison cold rolled (mild) steel has been chosen and its weldability designated as "excellent."
 A - Excellent E - Poor
 B - Very Good H - Very Poor
 C - Good K - Impractical
 D - Fair

- SPECIAL INFORMATION**
1. Good weld strength.
 2. May be welded under special conditions.
 3. Low weld strength.
 4. No actual weld nugget occurs, a "stick" is obtained.
 5. Welding conditions must be accurately controlled.
 6. Keep electrode clean to prevent sticking to the work.
 7. Good practice recommends cleaning steel before welding.
 8. Use one flat tip to minimize distortion or discoloration.
 9. Coating may dissolve in other metals or burn away.

The process of resistance welding makes it possible to join most metals, similar or dissimilar. Bonds of adequate strength are obtainable for an extremely wide range of applications. Selecting electrodes of the proper alloy is a most important consideration in producing good welds at the required speed. The chart below is a valuable guide to this selection.

The weldability of two materials as expressed in the following chart has been derived after careful laboratory study and field survey of many factors which influence the welding or resultant weld of the metals. The factors include:

1. Thermal and electrical conductivity
2. Metallurgical properties
3. Nature of resultant weld or alloy
4. Weld strength
5. Relative accuracy in control of welding conditions necessary

The weldability of metals as shown in the chart applies only when conventional spot welding methods are used on similar thicknesses of material. However, many metal combinations which are listed as having a "poor weldability" may be satisfactorily joined by using a special setup or procedure.

There is a TUFFALOY Alloy for each specific welding application. Experienced TUFFALOY engineers will provide assistance with special problems.

The following charts are for converting nose or material specifications between RWMA, ISO and JIS standards. Please note that when converting nose callouts from one standard to another, the tapers on the electrodes, caps, shanks, and holders are typically different and incompatible with each other.

This Chart shows graphically the importance of Electrode maintenance. This is not only important from the quality of the weld, which is of first importance, also extra load added to the welding machine and equipment. Read the data on the chart, you can then draw your own conclusions.

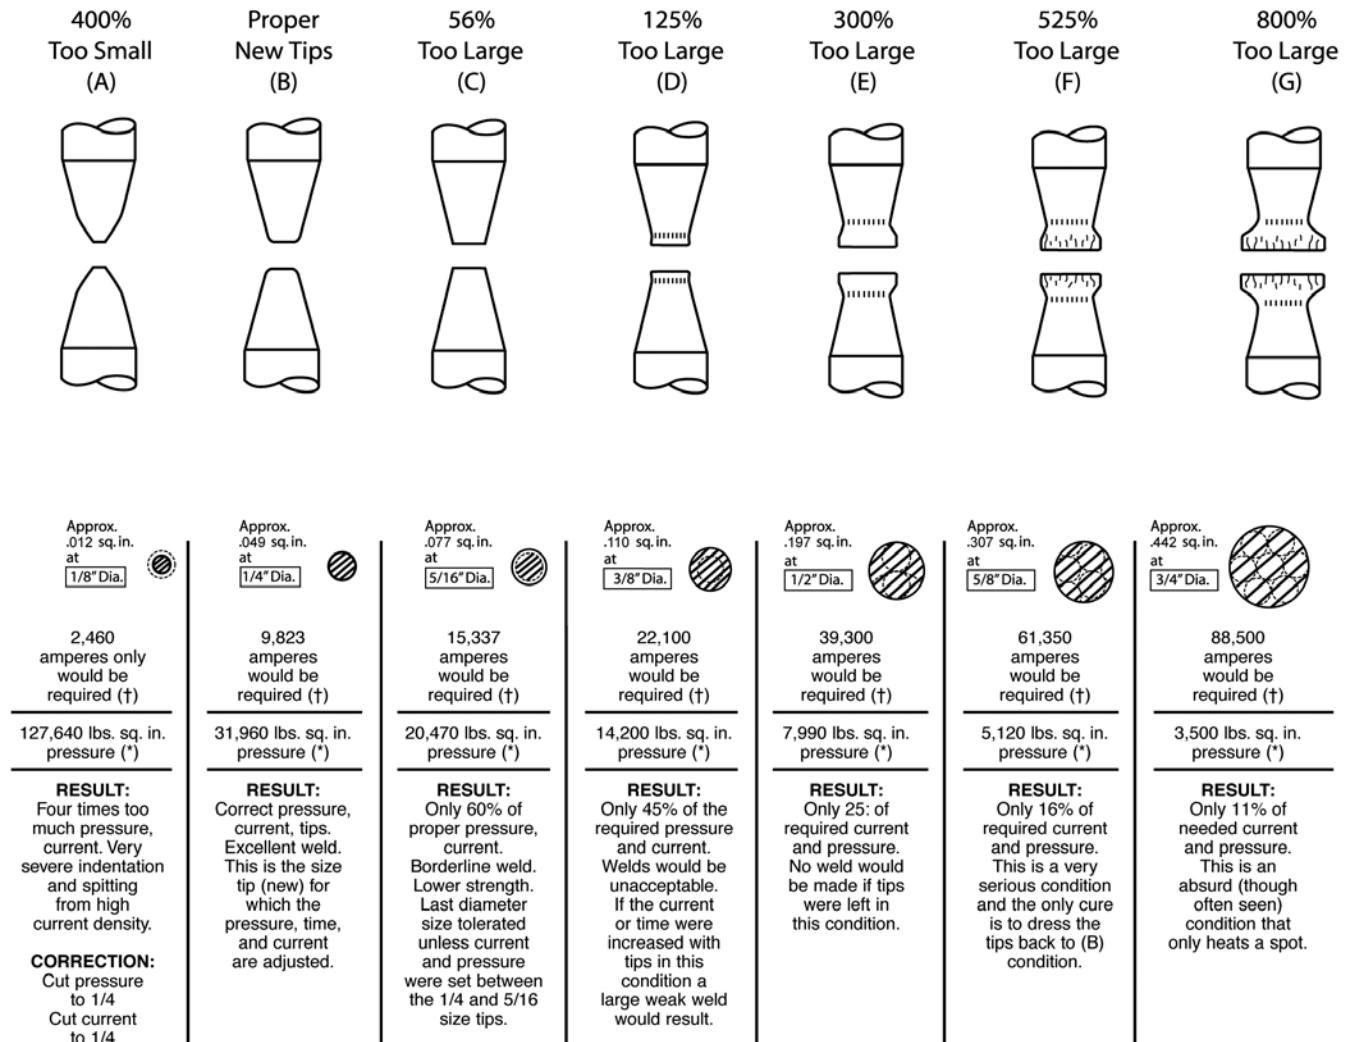

YOU CAN'T AFFORD TO NEGLECT YOUR ELECTRODES!

Keep your Electrodes dressed for maximum production and quality welds.

A TIP DRESSER WILL PAY DIVIDENDS!

We can supply you with hand operated Tip Dressers or Pneumatic Power Driven Dressers. Design or type will depend on your production requirements. [Pages 54 & 55.](#)

NOTES:

- Low Carbon Steel as hot rolled, pickled, and slightly oiled with an ultimate strength of 42,000 to 45,000 PSI Similar to SAE 1005—SAE 1010.
- Electrode Material is RWMA Class 2.
- Surface of steel is lightly oiled but free from grease, scale or dirt.
- Minimum weld spacing is that distance for which no increase in welding current is necessary to compensate for the shunted current effect in adjacent welds.

- Radius Face electrodes may be used:
0.010 to 0.031 — 2" Radius
0.031 to 0.078 — 3" Radius
0.078 to 0.125 — 4" Radius

- Weld time is indicated in cycles of 60 cycle frequency.

- Tensile shear strength values are based on recommended test sample sizes:

Direction of Force	Thickness	Width	Length
	.000" to .029"	5/8"	3"
	.030" to .058"	1"	4"
	.059" to .115"	1-1/2"	5"
	.116" to .190"	2"	6"

- Tolerance for machining of electrode diameter "d" is ±.015" of specified dimension.
- Electrode force does not provide for force to press ill-fitting parts together.

0.123	7/8	3/8	120	2000	20000	42	0.48	7200	2	1-1/8

NOTES:

1. Material must be free from dirt, grease, paint etc. prior to welding, but may have light oil.
2. Two equal metal thicknesses of each gage.
3. Commercial coating weight is 1.25 oz. per square foot.
4. Electrode Material-RWMA Group A, Class 2.
5. Water Cooling: 2 gallons per minute.

Projections should be larger in diameter for galvanized than for uncoated material.

NOTES:

- Type of Steel—Low Carbon SAE 1010—0.15% Carbon Maximum.
- Material free of scale, oxide, paint, dirt, etc.
- Size of projection determined by thickness of thinnest piece and projection should be on thickest piece.
- Data is based on thickness of thinnest sheet for two thicknesses only. Maximum ratio between two thicknesses = 3 to 1.
- See TABLE BELOW for design of punch and die for making projections.
- Contacting overlap does not include any radii from forming.
- Projection should be located in center of overlap.
- Tolerance for Projection Dimensions:

Dimension	Thickness Up to 0.050"	Thickness Over 0.050"
Diameter "D"	± 0.003 "	± 0.007 "
Height "H"	± 0.002 "	± 0.005 "

- Electrode Material:
RWMA Class 3, Class 11 - 10 W

- Data for total thickness of pile-up not exceeding 4 "T". Maximum ratio between two thicknesses 3 to 1.
- Electrode material, RWMA Class 3.
- For large assemblies minimum contacting overlap indicated should be increased 30 per cent.

From American Welding Society "Recommended Practices for Resistance Welding"

POSSIBLE CAUSE OF WELD DEFECT		TYPE OF DEFECT							
		EXPULSION AT WELD INTERFACE 	SURFACE EXPULSION ELECTRODE STICKING 	ELECTRODE MUSHROOM 	LOW WELD STRENGTH 	EXCESSIVE WELD INDENTATION 	INTERNAL CRACKS IN WELD NUGGET 	CRACKS IN PARENT METAL 	DISPLACE WELD NUGGET

POOR HEAD FOLLOW-UP		✓	✓			✓	X		
WELDER HEAD IMPACTS WORK				X		X			
POOR VOLTAGE REGULATION		✓	✓						
POOR AIR PRESSURE REGULATION		✓	✓						

NOTE: Causes Considered Individually

X = MORE PREVALENT

✓ = LESS PREVALENT

Many factors affecting electrode cost and useful electrode life are briefly outlined below.

PART TO BE WELDED

Lay out the part for resistance welding. Designing engineer, welding engineer and production man in charge of welding should cooperate in securing a better product at lowest cost.

Correct design permits the use of standard straight electrodes: or standard offset or standard angular holders if the straight approach is not possible. Special shaped electrodes cost more, and the difficulty of cooling the electrode is amplified. Single spot, multiple spot, projection, or other method may be accurately chosen to achieve lowest cost. Consult the R.W.M.A Manual.* PN: RWMA-BOOK

MATERIAL TO BE WELDED

The weldability of the materials can be determined by consulting your material supplier, and by reviewing recommendations covered in the R.W.M.A Manual.*

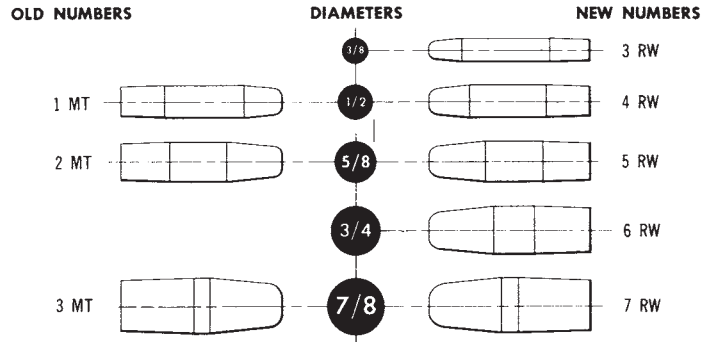

Surface conditions, rust, oil, dirt, and, on many articles, oxide film and even handling marks have a decided effect on weld quality. Cleaning may have to be a part of the welding job in some cases.

WELDING EQUIPMENT AND CONTROL

A welding machine of reputable quality purchased for a particular application will be correctly designed both electrically and mechanically, and will be supplied the correct control equipment and electrodes for the work.

On machine change-overs make sure of adequate electrical and mechanical capacity, and see that the necessary controls are provided. Consult us when redesigning or revising your choice of electrodes.

The RWMA tip numbering system has generally replaced the old Morse taper numbers with new "RW" numbers, and has added two new sizes, as the chart illustrates.

ELECTRODE LIFE SAVERS

1. Use standard Tuffaloy electrodes with Tuffaloy ejector type, self-adjusting tube, water-cooled electrode holders wherever possible. Avoid special or irregular shapes for lowest cost.
2. Use ample cold cooling water as close as practical to the welding contact surface, properly circulated at a minimum of 30-psi pressure, and supplied at a rate of at least 1-1/2 gallons per minute.
3. Be sure to select the proper type and size of electrode, taking into consideration electrode pressure, contact area of electrode, gauge, and nature of material to be welded. Consult the RWMA Manual* or your Tuffaloy field engineer regarding recommended practices. Overloading as well as overheating shortens electrode life.
4. Good welds depend upon properly maintained electrodes which assure an accurate surface contact. Keep tapers clean and dress electrode faces with lathe, emery paddle or fine file. Use castor oil or graphite grease to facilitate tip removal, and avoid application of insulators such as teflon tape and other materials.

STANDARD GAGE CHART

Thickness in Decimals of an Inch

Gage No.	Manufacturer's Standard	Gage No.	Manufacturer's Standard	Gage No.	Manufacturer's Standard
3	0.2391	12	0.1046	22	0.0299
4	0.2242	13	0.0897	23	0.0269
5	0.2092	14	0.0747	24	0.0239
6	0.1943	15	0.0673	25	0.0209
7	0.1793	16	0.0598	26	0.0179
8	0.1644	17	0.0538	27	0.0164
9	0.1495	18	0.0478	28	0.0149
10	0.1345	19	0.0418	29	0.0135
11	0.1196	20	0.0359	30	0.0120

* Resistance Welding Manual, published by the Resistance Welder Manufacturers Association. PN: RWMA-BOOK

RESISTANCE WELDING MACHINE SETUP

TO DETERMINE SPOT WELDING SCHEDULE

$CURRENT = 2T \times 100,000 = AMPERES$
 $TIME = 2T \times 100 = CYCLES$
 $PRESSURE = 2T \times 6000 (LB) = FORCE REQUIRED (LB)$
 $T = THICKNESS OF THE THINNEST PIECE$

APPROXIMATE PRESSURE EXERTED BY AIR CYLINDER SIZE

DIAMETER	CYLINDER AREA SQ. INCHES	WELDER GUAGE PRESSURE	ELECTRODE FORCE PRESSURE
4"	12.5	x	=
5"	19.5	x	=
6"	28.0	x	=
8"	50.0	x	=

RESISTANCE WELDING**DO'S**

- Use the RWMA recommended electrode material for the job you are running.
- Use RWMA standard electrodes whenever possible.
- Use the appropriate electrode diameter for the material being welded.
- Use open sight drains or have water flow gauges on out bound side to easily confirm water flow.
- Connect the water inlet hose to the proper holder inlet to insure water flows through the center cooling tube first.
- Recommended water flow for the electrodes is 1.5 gallons per minute of cold water.
- Insure that the water tube extends within 0.25" of the bottom of the electrode water hole.
- Adjust the water tube position when changing to another length electrode.
- Check water tube ends to insure they are not damaged and have an angled cut at the end to prevent water restriction.
- Use ejector type holders to simplify electrode removal.
- Keep the electrode and holder tapers clean to ensure good leak free conduction.
- Dress electrodes frequently to insure good quality welds.
- Dress electrodes in a lathe to their original contour whenever possible.
- Use raw-hide or hard rubber hammers for alignment of electrodes.
- Provide cooling water on the exit side top and bottom of seam welding applications.
- Use properly designed knurling wheels to insure continuous dressing of the seam welding wheel.
- Lock out the machine when performing any type of maintenance.

DON'TS

- Never use unidentified electrodes or materials.
- Avoid special, offset, or irregular electrodes when the job can be done with standard electrodes.
- Do not use small electrodes on heavy gauge welding jobs or large electrodes on small gauge materials.
- Do not forget to turn the water on full force before starting to weld.
- Never use water hoses that do not fit the water fitting properly.
- Do not allow water connections to become leaky, clogged or broken.
- Avoid holders with leaking or deformed tapers.
- Never use holders that do not have adjustable water deflector tubes.
- Never use pipe tape or similar product to stop a leak.
- Do not let your electrode mushroom excessively.
- Do not dress electrodes with a file.
- Do not use a steel hammer to adjust any part of a welding machine.
- Avoid the use of seam welder wheels too thin to stand the heat or pressure of your job.
- Do not permit seam welding wheels to run off the edge of the work piece.
- Do not enter a work cell or reach into a welder without using your lockout.
